

Make sure you have a working version of Microsoft Excel, especially in Office 365 – you must download the Excel program. Desktop version is preferred.

Download the current version of Quick Quote from the customer portal. Once downloaded, the file should appear in your download folder unless you have designated an alternate location.

The Quick Quote pricing spreadsheet includes macros. Macros has to be enabled for the spreadsheet to function correctly.

NOTE: The file is not compatible with Google Sheets.

When the file is opened a security message may appear, please select the icon button to enable content.

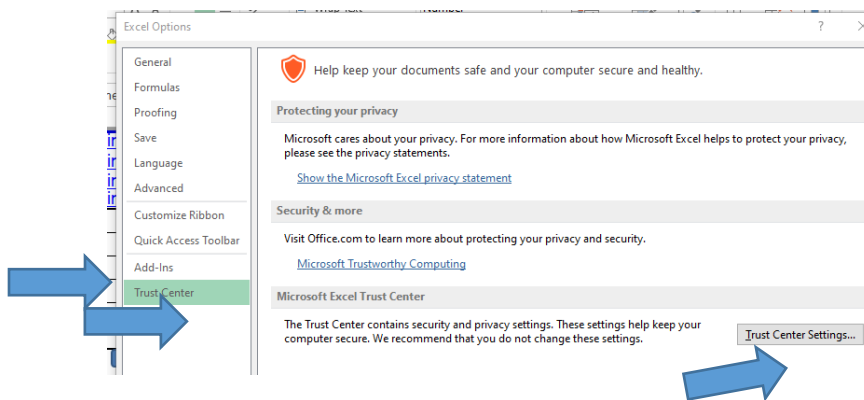

If you continue to experience issues, then go to the TRUST CENTER SETTINGS. This can be found by selecting the File Menu and selecting OPTIONS.

Click on the Option for the next screen to appear. Select TRUST CENTER.

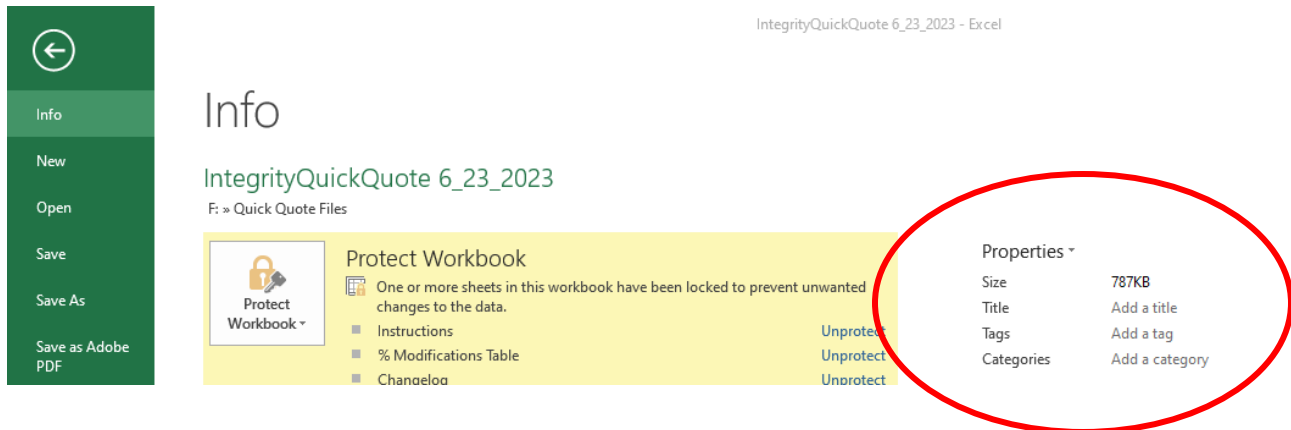

Once click on TRUST CENTER SETTINGS – Choose the 2nd option, “Disable all macros with notification”. This will cause the “Enable Content” message to appear the first time you open the file. Once you have enabled the macros you will not see the message in the future.

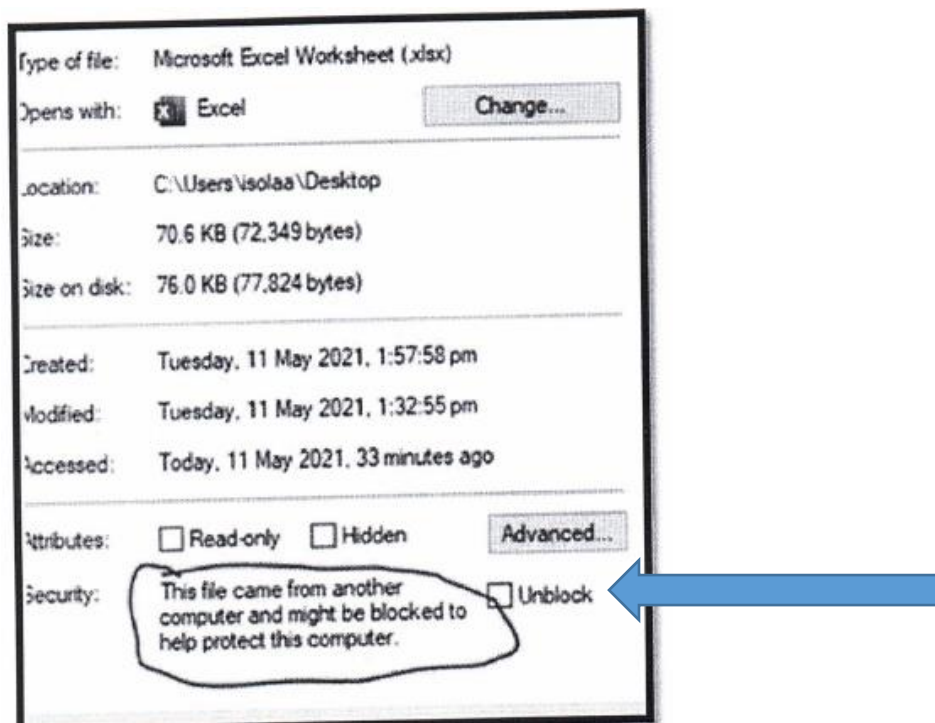

Note: Macros will not be allowed to run if the top option of “Disable all macros without notification” is checked. **If you do not have the ability to check another option, it is possible that your company IT/System administrator has blocked access to all macros.

The other step to look into if macros is still not working properly is to confirm that the file is not “blocked” due to an update by Windows or Microsoft security update possibly.

You may see something that looks like the box below. If the security message indicates the file is possible blocked, then click on the box to UNBLOCK.

If you continue to encounter issues, then please consult your IT/System Administrator for further assistance.
